SERVICE	SUPPORT MODEL
Day Centre and Aquatic Activity (on site)	1:1 on site
PREPARED BY	PREPARED FOR
Victor Casanova (Day Centre)	Family · NHS / funding teams

This combined report summarises how Timi has settled into clubSENSational Day Centre since **31 May 2026**. It describes a carefully paced transition from brief car-supported visits to a full two-hour on-site routine, including classroom, sensory and aquatic activity, and sets out the support model that currently works for him.

Sessions remain **on site**. The present model is **1:1**. If Timi later accepts a longer day or access into the community, a move to **2:1** would be required to keep that offer safe and meaningful.

1. OVERVIEW: SETTLING AND PRESENTATION

OVERALL PICTURE

Timi's settling has been gradual, intentional and highly successful. He began with seconds of exposure at the Hub doorway while remaining closely linked to mum and carers, and has progressed to spending approximately two hours at the centre, following a predictable routine of circle time, short classroom and sensory activities, and a structured transition into the hyperoxic pool. He now accepts long, regulated periods in the water and is working within **Level 1** of the aquatic programme (water familiarisation and acceptance of the medium). Progress has been clearly positive.

RECORDED FEEDBACK OUTCOMES

A paced settling journey with strong aquatic gains

31 May to mid-July 2026 · selected portal records

9+

SESSION FEEDBACK RECORDS REVIEWED ACROSS
MAY-JULY

Mon / Fri

REGULAR DAY CENTRE ATTENDANCE PATTERN

Engagement

Rated sessions · sample
average

Rated entries range from 1 to 5. Strongest settling days score 4-5; lower scores usually reflect transition or pool-readiness load rather than overall placement failure.

Regulation and emotions

Typical presentation when settled

Independence

Support level on rated days

He benefits from familiar adults, low language, visuals and paced demands. Independence rises when the sequence is known and sensory needs are met early.

Dashboard figures combine portal session feedback with Day Centre observations across the settling period. Engagement is variable by design of a graded transition; the direction of travel – from doorway exposure to a two-hour aquatic-inclusive day – is strongly positive.

Timi is non-verbal and benefits from PECS / visuals, familiar staff interpretation and a calm, low-language approach. He responds best to predictable sequencing, preferred motivators (including music where appropriate), and reduced waiting. Parent request remains that he is not taken off premises; food is provided by family as agreed.

Staff feedback highlights

Selected directly from session records

“

MAY

Participated in lots of activities.

V. Matilla, session feedback, 15 May 2026

“

LATE JUNE

Practised throwing and picking up objects in the small pool... he jumped into the pool.

R. Reali, aquatic feedback, 29 June 2026

“

EARLY JULY

Described as a spectacular session: routine followed on arrival, calm full swim, positive snack and leave, with photos and videos shared with family.

Day Centre team notes, 3 July 2026

“

ONGOING

Carers and mum have commented on how calm and participating he can be on strong settling days, and have expressed happiness with progress even when a session needed more support.

Family / carer handover notes, July 2026

2. GRADUAL TRANSITION INTO THE DAY CENTRE

From **31 May 2026**, Timi began attending with mum and carers. Early visits were deliberately low-demand. The Hub door was left open with his motivators and preferred items visible so that he could approach the environment at his own pace while still linked to the car and familiar adults.

SECONDS

Very short entries into the classroom / Hub, then an immediate return to the car. The aim was positive association, not duration.

MINUTES

Time inside was increased gradually. Brief, positive interactions with known staff (including Victor and Raul) were introduced and were well received.

~20 MINUTES

Following those successful micro-interactions on visit days, he began staying in the Hub for around twenty minutes.

CLASSROOM

He then accepted structured classroom activities: motor coordination and motor skills, sensory work, and regulation support inside the class.

NEW ENVIRONMENT

After approximately two days of spending around an hour in class, the Pristine Environment / hyperoxic pool area was introduced. On one key day he sat in a chair within the pool environment, accepting being in a different sensory space.

TWO HOURS

Progressively, the routine was built until he was spending **two hours** at the centre from approximately 7 July 2026 (date to be confirmed).

SCHEDULE CHANGE

Early sessions were typically in the afternoon (**13:00–15:00** / “1 to 3”). As settling progressed, the slot moved to **11:00–13:00**, which is his current pattern on Mondays and Fridays.

3. DAILY STRUCTURE AND ON-SITE SUPPORT (1:1)

Timi is currently supported on a **1:1 basis on site**. This model fits the present two-hour block: arrival and settling, circle time, short activity routines, pool transition, aquatic time, shower and leave. One consistent adult can pace demands, interpret communication, manage personal care and keep the sequence predictable within the building.

A typical successful flow is now:

STAGE	WHAT HAPPENS	FOCUS
Arrival	Settle with familiar adults; belongings / greetings as tolerated	Low demand, positive association
Circle time	Shared start to the session	Belonging, predictability
Short activity block	Motor skills, table work, sensory and regulation activities	Engagement before water
Pool transition	Changing, shower, move into the pool environment	Paced, low-pressure
Aquatic block	Water familiarisation, motivator games, early aquatic skills	Regulation and Level 1 skills
Close	Shower (enjoyed), snack where relevant, leave with carers / mum	Calm ending, family handover

WHAT 1:1 ENABLES ON SITE

- One adult leading the known routine end to end
- Immediate response to toileting or regulation needs
- Flexible pacing of classroom and pool demands
- Safe supervision in Hub and pool environments within a short block

CORE ACTIVITY PILLARS

- Circle time and Hub belonging
- Motor coordination / fine-motor table work
- Sensory and emotional regulation
- Aquatic familiarisation (Level 1) and shower routine

4. CLASSROOM, MOTOR SKILLS, SENSORY AND REGULATION

Once Timi accepted longer stays, classroom time became an active part of the day rather than only doorway exposure. Staff introduced motor coordination and motor-skill tasks, sensory activities and regulation support inside the class. Portal notes from earlier settling also show engagement with puzzles, sorting, matching and other table-top sequences when he is ready.

Engagement is strongest when waiting is reduced, preferred spaces or motivators are available early, and transitions are signalled clearly. When sensory or emotional load rises — for example through excitement or anxiety — behaviours are treated as communication: a need for predictability, personal care support, or more time.

5. AQUATIC ACTIVITY AND WATER FAMILIARISATION (LEVEL 1)

CURRENT AQUATIC PICTURE

Timi now accepts being in the water for extended periods on his own terms — typically around **thirty minutes** of calm, regulated enjoyment of the medium within his session. Small aquatic skills and movements have begun. This sits within **Level 1** of the clubSENSational aquatic pathway: water familiarisation and acceptance of the aquatic environment. Progress has been very positive.

Pool progression was graded with the same care as the Hub transition:

- **Initial refusal:** At first he rejected entering the water and interacted mainly with spasms / high tension around the pool edge, without accepting immersion.
- **Motivator retrieval from outside:** Preferred toys and motivators were integrated so that he collected them from outside the pool and sorted them into a bag — building a functional game without forcing entry.
- **Retrieval inside the pool:** Gradually he accepted collecting toys from inside the water, entered, completed the pick-up routine, and left after several minutes of accepted immersion.
- **Shower:** He accepted and enjoyed showering as part of the changing / aquatic routine.
- **Extended independent comfort:** He can now remain in the water for longer stretches, regulated and enjoying the environment, with early Level 1 aquatic movements being introduced.

On 29 June, aquatic feedback recorded practice throwing and picking up objects in the small pool, including jumping in — consistent with the motivator-retrieval pathway. On stronger July days he has completed calm, full participation swims; on harder days staff still reduce demand, protect positive association, and never force performance.

Practised throwing and picking up objects in the small pool. We made him pick the toys up and he jumped into the pool.

R. Reali, aquatic session feedback, 29 June 2026

6. SUPPORT MODEL NOW AND LOOKING AHEAD

CURRENT RECOMMENDATION

1:1 on site is the model in use for Timi's present Day Centre and aquatic block. Sessions remain within the building. Community access is not part of the current offer, in line with family preference that he is not taken off premises.

If in future Timi accepts a longer day at the centre, or if community access becomes an agreed goal, **2:1 support would be required**. A second adult would be needed to manage transitions, personal care and environmental load safely while preserving the quality of the activity for him and for peers. That step is noted here as a forward-looking contingency, not as a present community programme.

IMPACT OF THE CURRENT 1:1 MODEL

Within the two-hour on-site block, 1:1 has been sufficient to deliver the graded transition, classroom engagement and aquatic familiarisation described in this report. Extending intensity or leaving site without increasing to 2:1 would reduce safety and the chance of success.

7. HEALTH, PERSONAL CARE AND CHALLENGES ENCOUNTERED

Alongside strong gains, staff have worked with recurring personal-care and regulation challenges. These are recorded openly because anticipating them has improved sessions:

- **Toileting accidents:** Occasional wetting linked to high excitement and/or toileting need. Accidents are managed promptly, carers are informed, and the day continues without shame. Strategies have included proactive changing / nappy use for the centre period on agreed days, with carers asked to pack towel, flip-flops and underpants.
- **Faecal digging / hand-to-bottom behaviour:** At times Timi has dug with his hand at his bottom and removed faeces. Staff redirect him into the known routine, increase anticipation and supervision around vulnerable moments, and have seen improvement when the sequence is tight and demands are well paced.
- **Variable pool readiness:** Some days still show resistance at the pool or changing stage; the response remains patience, reduced demand and protection of long-term water confidence.
- **Health profile awareness:** Asthma, hay fever, cat/dust sensitivity, constipation and foot/orthopaedic concerns (including trampoline restrictions) are held in the care profile. Parent-provided food continues.

None of these challenges reverse the overall settling picture. They guide how the team anticipates needs so that Timi can keep accessing the successful parts of his day.

8. PROGRESS AND DEVELOPMENTAL IMPACT

Across the period from late May into July, Timi has shown meaningful developmental and quality-of-life gains:

- From doorway exposure measured in seconds to a sustained **two-hour** Day Centre block
- Acceptance of circle time, short classroom routines, and sensory / regulation work on site
- Positive micro-interactions with Day Centre staff, building trust with familiar adults
- Acceptance of the Pristine / pool environment, including sitting in that space before full aquatic participation
- Graded water entry via motivator games through to ~30 minutes of regulated aquatic enjoyment
- Entry into **Level 1 aquatic skills** (water familiarisation and movement in water)
- Positive shower association within the aquatic routine
- Successful timetable shift from afternoon to morning slots
- Improving anticipation and redirection around toileting and faecal-digging behaviours

- Warm family / carer partnership, including photo and video sharing on strong days

9. SUMMARY AND RECOMMENDATIONS

Timi has settled into clubSENSational Day Centre through a carefully graded transition that respected his need for predictability, motivators and low-pressure exposure. He now follows a meaningful on-site routine and has made particularly strong progress in aquatic familiarisation. Challenges around toileting and faecal digging remain active support themes, but they are being managed with clearer anticipation and routine-based redirection.

WE RECOMMEND

1. Continue **1:1 on-site support** for the current Monday / Friday two-hour Day Centre and aquatic block.
2. Keep sessions **on site** unless and until family and commissioners agree a different goal.
3. If the day is lengthened or community access is introduced later, plan and fund a move to **2:1**.
4. Protect the successful sequence: arrival → circle time → short activities → paced pool transition → aquatic block → shower / leave.
5. Continue **Level 1** aquatic work — celebrate acceptance and regulation; introduce skills without pressure.
6. Maintain agreed personal-care strategies (proactive toileting / nappy planning; close supervision and redirection around faecal-digging moments).
7. Preserve the **11:00–13:00** slot while it supports regulation and engagement.
8. Continue photo / video handovers and joint review of strategies with mum and carers.

Timi has demonstrated that, with a graded transition and familiar 1:1 support, he can be calm, engaged and successful in this setting. Continued partnership between home and the Day Centre will consolidate these gains and protect the quality of his experience as next steps are considered.
