

PORTALVIC

Source

Who changes what in the portal, where it is stored, and how admin screens stay in sync with staff dashboards. Admin can make many term changes directly in the app (no terminal). Victor maintains the long-term foundation in the repo and deploy pipeline.

Golden rule: one logical source per data type. Base roster lives in the repo; live admin edits layer on top via Supabase and must appear the same in Admin and Staff.

1. Two layers (how sync works)

Think of the system in two layers. Both matter; they stack rather than replace each other.

- Layer 1 - Term foundation (repo + deploy): the default term roster and staff-hour templates shipped with each Vercel release. Victor updates these from the machine.
- Layer 2 - Live admin edits (Supabase): changes saved from Admin screens. Applied on top of Layer 1 immediately for Admin and Staff (Realtime merge). No redeploy required.

If Admin and Staff disagree, check Layer 2 first (override not saved / wrong scope). If the whole term baseline is wrong, Victor fixes Layer 1 and may fold Layer 2 changes back into it.

2. Layer 1 - Term foundation (Victor / machine)

A. Participant roster (MADRE JSON): Default sessions: participant, date, time, service, venue, pool
working_ui/portal/roster_term_master.json. Visual editor: roster_term_master_review

B. Staff pool hours template: Default who works which venue/time bands (not participant slots). Seeded in spreadsheet
staff-shifts.csv in repo for bulk edits.

Who edits: Victor (terminal + git push). Admin does not edit JSON files.

Where it affects: Staff dashboard, Lead dashboard, Admin Base schedule, session feedback, week counters - after c
(typically 5-10 min via Vercel).

Victor terminal steps when the baseline term changes:

- Edit roster_term_master.json (or export from the review grid).
- Run: python database/roster_review/sync_roster_madre_to_portal.py
- git commit + git push origin main (Vercel redeploys working_ui/).
- Spot-check Admin Base schedule + one affected staff login on the same date.

3. Layer 2 - Admin screens that save live (synced)

These screens write to Supabase. Changes should appear in Admin and Staff without Victor running terminal commands.

3a. Sprea

Menu: Admin -> Spreadsheet reference -> Staff hours.

What: Edit staff assignment cells (name + time band per venue/date). Click Save staff hours.

Stored in: Supabase table portal_staff_timetable_cells.

Scope: Staff pool hours from 2026-06-01 onward. Does NOT replace participant session rows (Fuente A).

- Admin: edit cells, Save, confirm staff dashboard shows new hours.
- Victor: only if save fails (RLS/auth) or template seed needs a term-wide reset in repo.

3b. Edit term slot

Menu: Admin -> Edit term slot (or link from Schedule & Covers).

What: Change a participant slot: time, instructor, venue, pool/area; cancel service; mark no participant.

Stored in: Supabase table portal_roster_rows (+ portal_roster_row_events audit).

Apply to (scope): This day only | Every [weekday] until end of term | Rest of term from anchor | Selected sessions.

- Every Sunday until end of term = term-wide change for that weekday pattern (live overlay, not JSON).
- Reload from roster = refill form from the deployed bundle (Layer 1 baseline).
- Admin: pick participant + service, set scope, Save term slot, verify on staff device.
- Victor: periodically merge permanent term-wide edits back into roster_term_master.json so Layer 1 and Layer 2 do not drift forever.

3c. Schedule & Covers (day overrides)

Menu: Admin -> Sessions - Schedule & Covers - Base schedule row actions.

What: One-off covers, moves, cancellations for a specific calendar day.

Stored in: Supabase schedule_overrides (+ related roster row events).

- Admin: use for a single date exception (e.g. Luliya covers Giuseppe on one Sunday).
- Victor: only if override visible in Admin but missing on Staff (sync bug).

4. Spreadsheet reference - Group sessions tab (read-only)

The Group sessions grid mirrors the roster week for reference. It is intentionally read-only here.

- Do NOT expect edits in this tab to save.
- To change participant slots: use Edit term slot or Schedule & Covers.
- To change staff hours: use the Staff hours tab.

5. Feedback merge rules (automatic)

When Aquatic + Multi-Activity run back-to-back with the SAME instructor (e.g. Yusuf/Roberto Sunday, Cyrus/Javier Wednesday):

- Staff day card: one block (e.g. 9:00-10:15) and ONE feedback form.
- This week counters: Aquatic and Multi-Activity still counted separately.
- Generated when Victor syncs Layer 1; Admin does not edit merge rules by hand.

6. Other data sources (quick reference)

Participant long profiles: database/clients_info_machine.csv -> clients_info_embed.js (Victor deploys).

Payments / finance grid: Clients Payments spreadsheet -> clients_payments_portal_data.js (Admin views; Victor exports).

Achievement photos: Admin -> Participant achievements (inbox assign, rotate, delete, bulk select). Supabase Storage.

7. What NOT to use as source of truth

- Editing Group sessions in Spreadsheet reference (read-only tab).
- Duplicate roster copies (old bundle + new JSON + undated templates at once).
- Submitted session feedback (historical record, not roster).
- Random Supabase row edits outside Edit term slot / Schedule & Covers / Staff hours save.

8. Who does what - summary table

Change type	Admin (app)	Victor (machine)	Live when
Staff pool hours	Spreadsheet ref. Staff hours + Save	Re-seed template if term reset	Immediate (Supabase)
Participant slot (one day)	Edit term slot OR Schedule & Covers	Only if sync broken	Immediate (Supabase)
Participant slot (whole weekday in term)	Edit term slot - Every [weekday]...	Fold into JSON MADRE later	Immediate (Supabase)
Whole term baseline	Request documented change	JSON MADRE + sync script + push	After Vercel deploy
Pool/area note only	Edit term slot or request	CSV or MADRE sync + push	Supabase or deploy
Achievement inbox photos	Participant achievements	Supabase migration if permissions	Immediate

9. Admin checklist before saving a term change

- One day only or whole weekday pattern? -> pick the right Apply to scope.
- Participant, date anchor, time, service, pool/area, instructor all correct?
- After Save: open Staff dashboard for that instructor on the same date.
- If term-wide and permanent: tell Victor to fold into roster_term_master.json.

10. Victor commands (reference)

```
# Sync participant roster foundation (Layer 1)
```

python da

Technical: Victor - GitHub PORTALVIC - Supabase Portal (cklpnwhlqsulpmkipmqb) - Deploy: Vercel working_ui/
